

Pokeball Tutorial

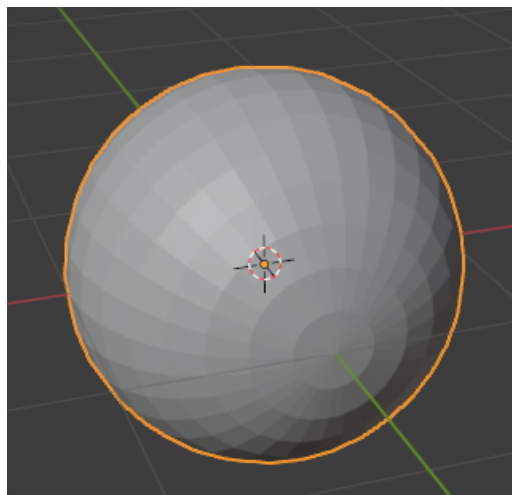

Important concepts covered: knife tool, solidify modifier, select loops, extrude

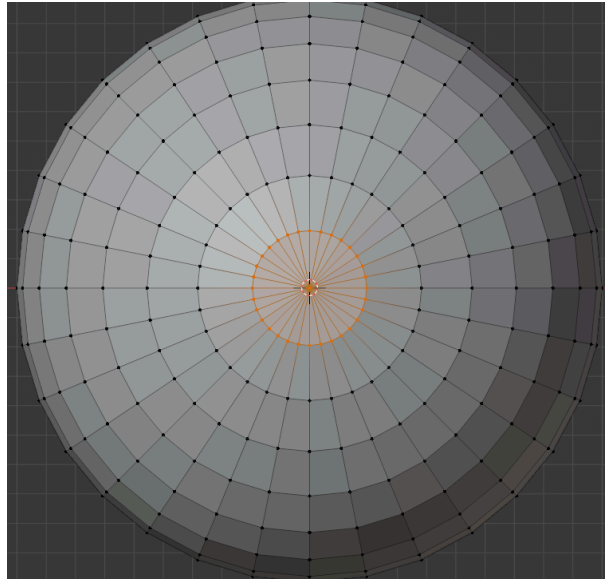

Let's start by deleting the default cube (DEL or X) and adding an UV sphere to the Scene (SHIFT+A → MESH → UV Sphere):

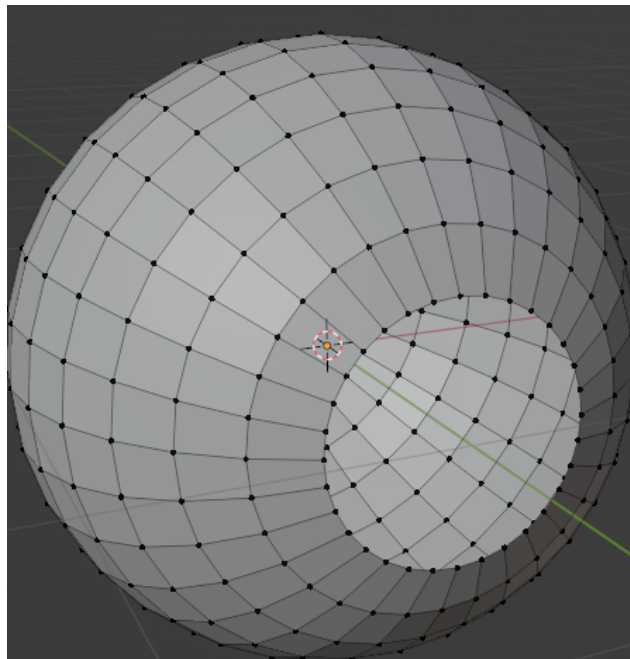

Now rotate the sphere along the X axis (R+X) by 90°:

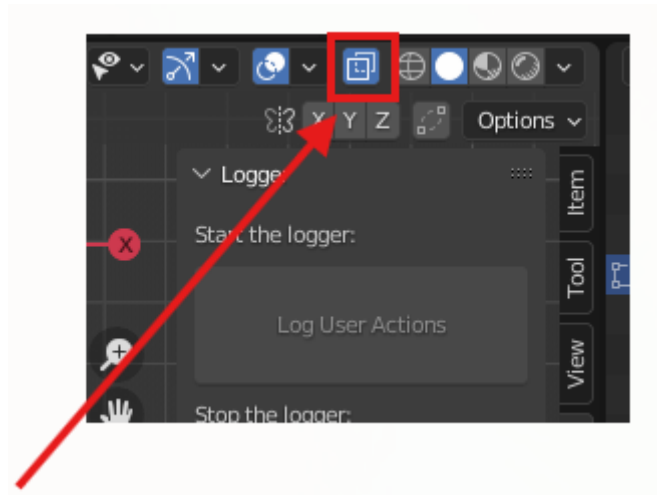

Enter edit mode (TAB), go to the front view (NUMPAD 1) and click and drag to select the following vertices:

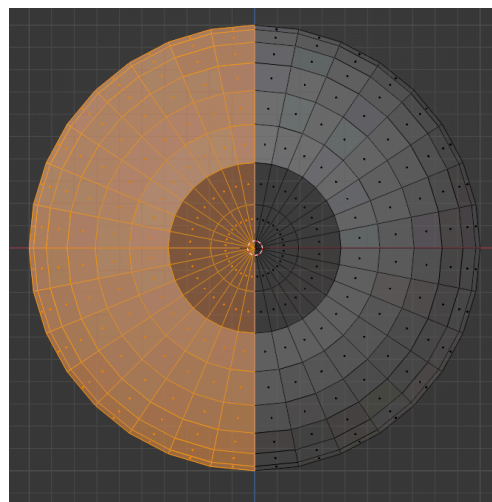

Then press “X” and select “Vertices”:

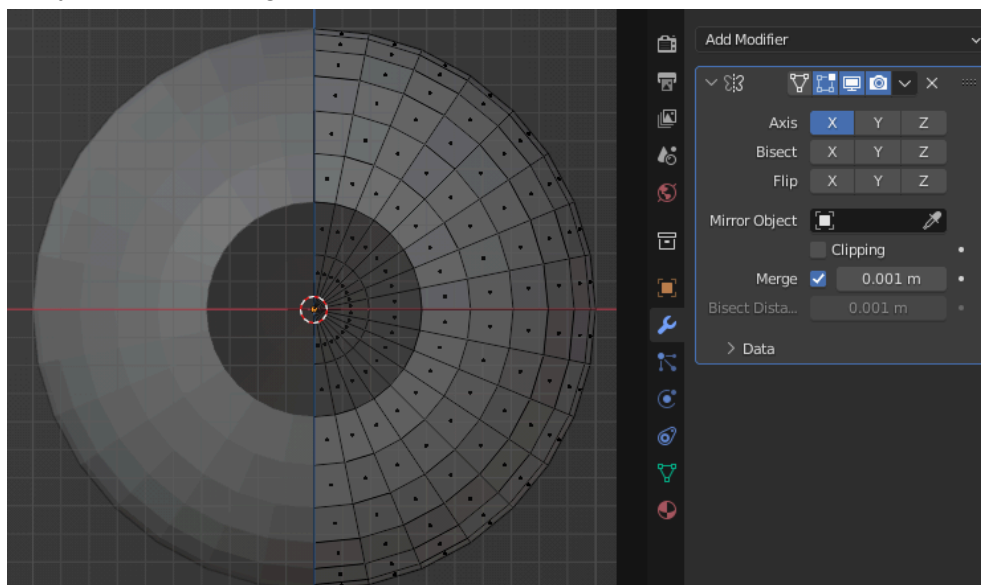

No go back to the front view and enable X-ray mode by clicking on it's icon on the top right corner of the screen:

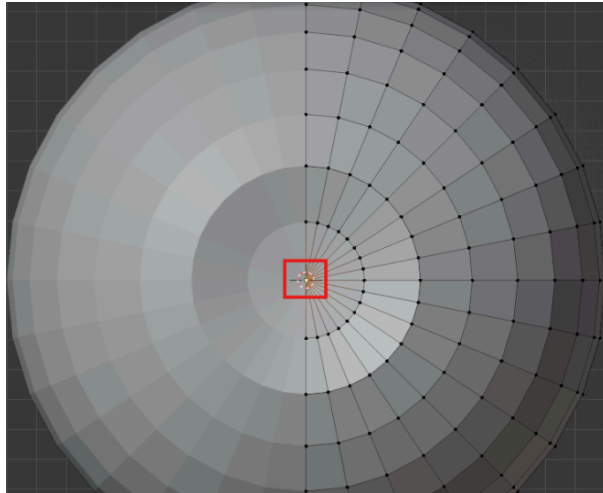

Then, change to face selection mode and select the left part of the pokeball:

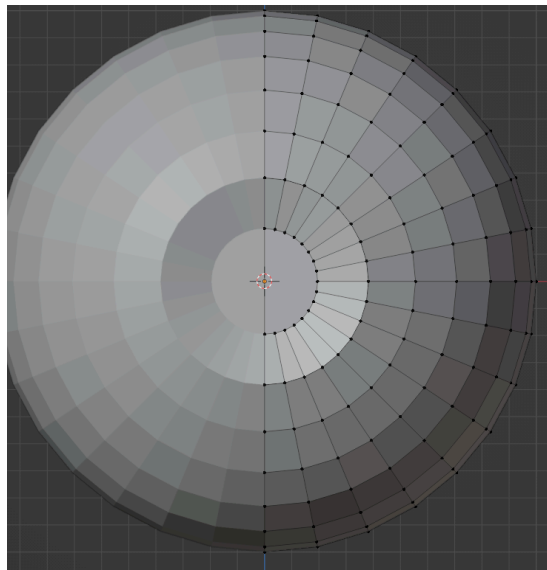

Make sure you are selecting all the left faces! Then, delete them and add a mirror modifier:

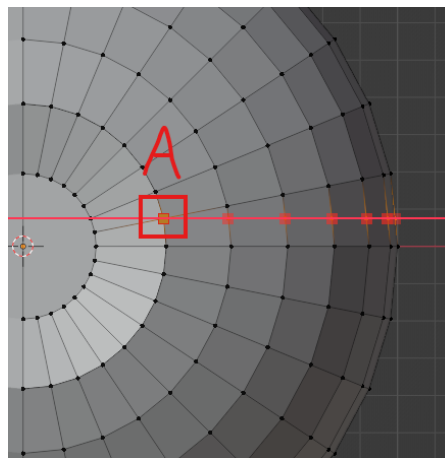

Now disable X-ray mode by clicking on it's icon again, change to vertex selection mode and select the central vertex:

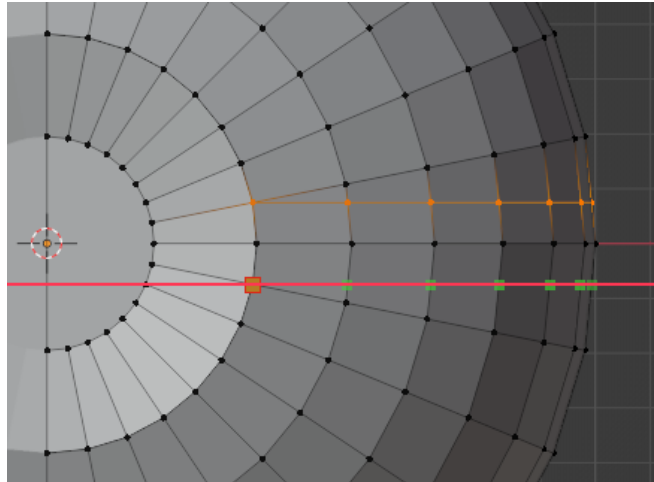

Then, press CTRL + X to dissolve the vertex:

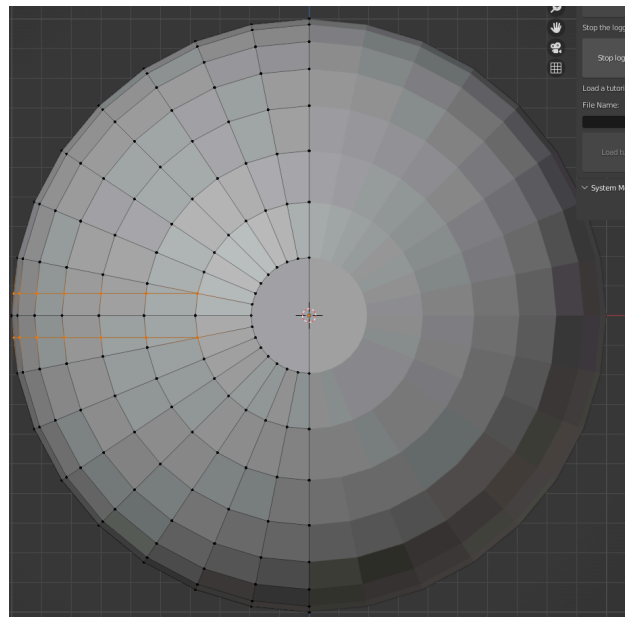

Now, press “K” to enable the knife tool, then press “C” once to enable “Cut through” and click on “vertex A” (check the image below) then press “X” to cut in the X direction and then move the mouse to the right until it has traversed the whole mesh. Then click once and hit ENTER:

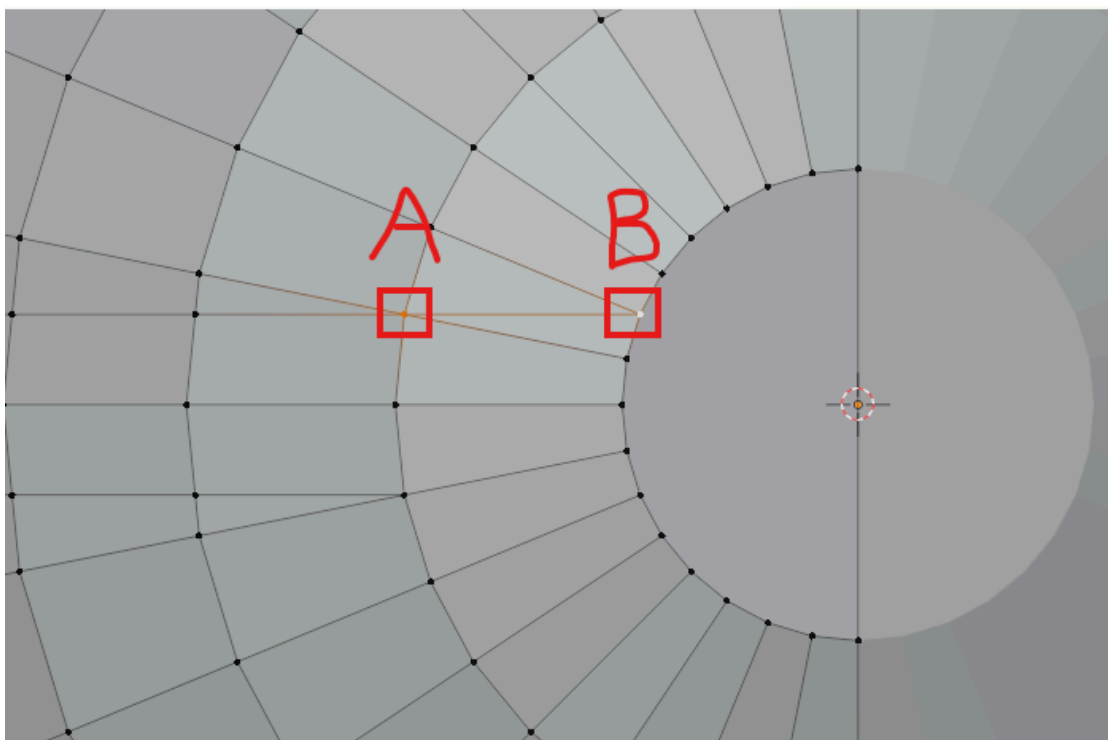

Next, do the same to the equidistant vertex from the X axis below (don’t forget to press “K” and then “C” to cut through the mesh):

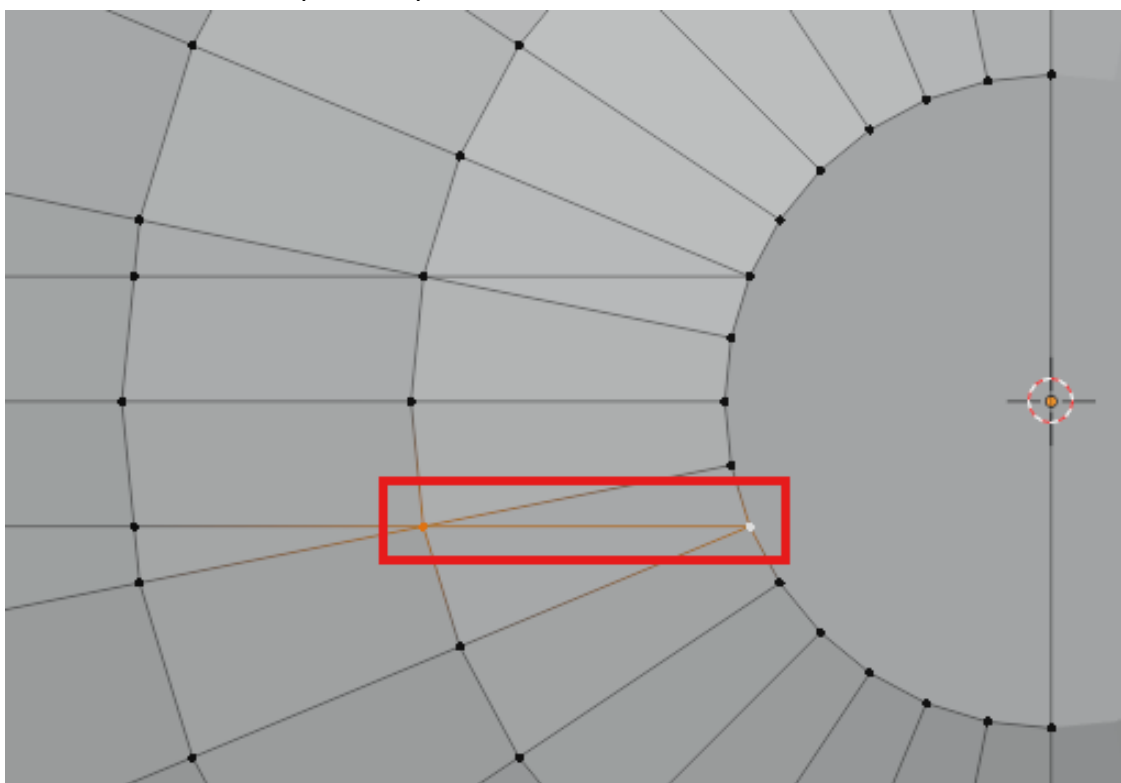

Now go to the Back view (CTRL + NUMPAD 1):

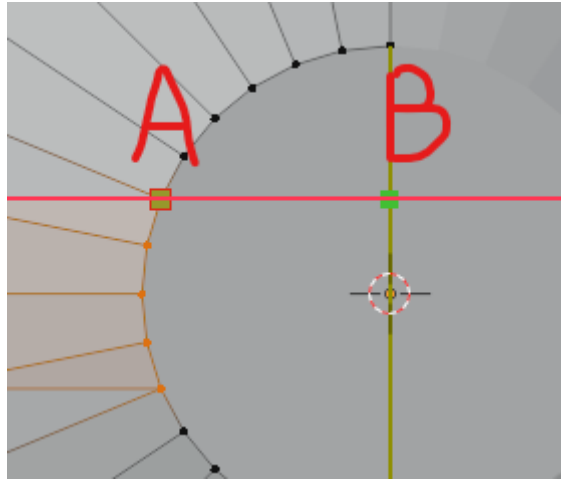

Select the vertices “A” and “B” (check the image below) and press “J” to connect both vertices:

Repeat the process to the vertices below them:

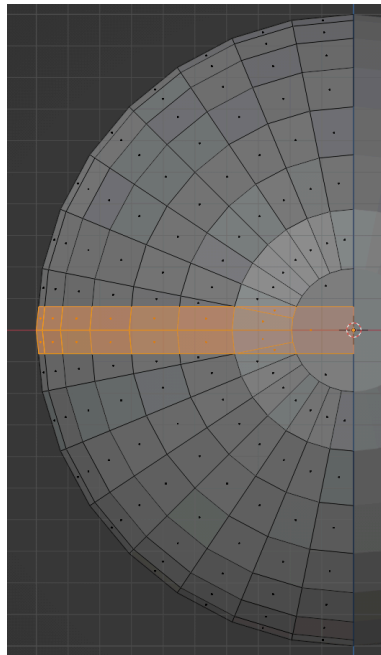

Now we have to cut the middle circle. In order to do this, press K again, click on vertex A, then press "X" to cut along the X axis and then click on the green square that appears on B. Then hit ENTER:

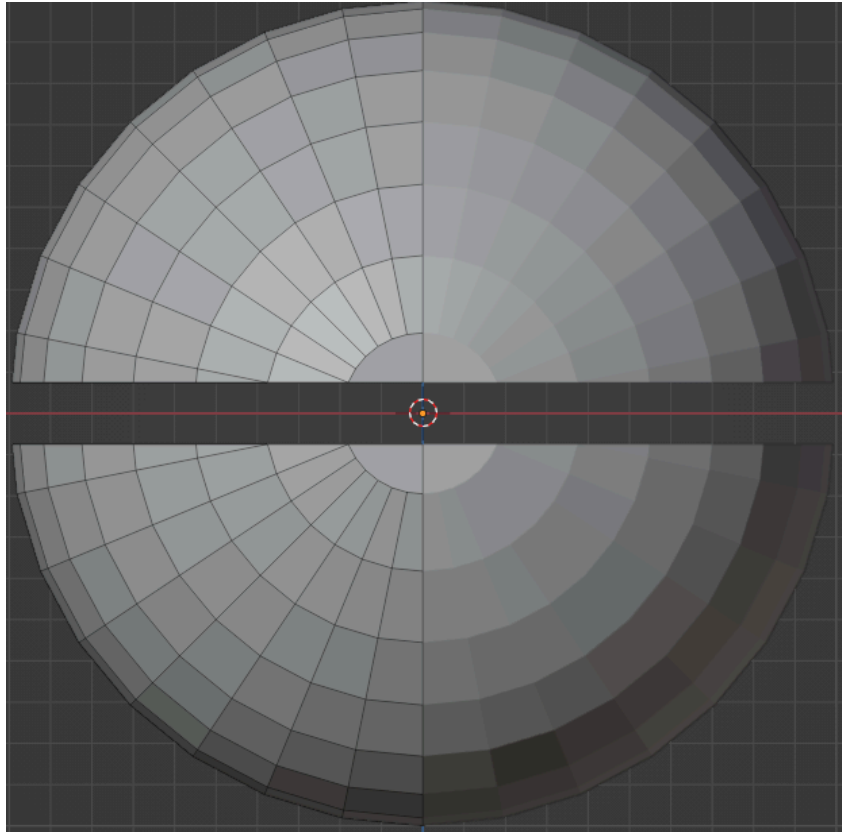

Repeat the process to the bottom part:

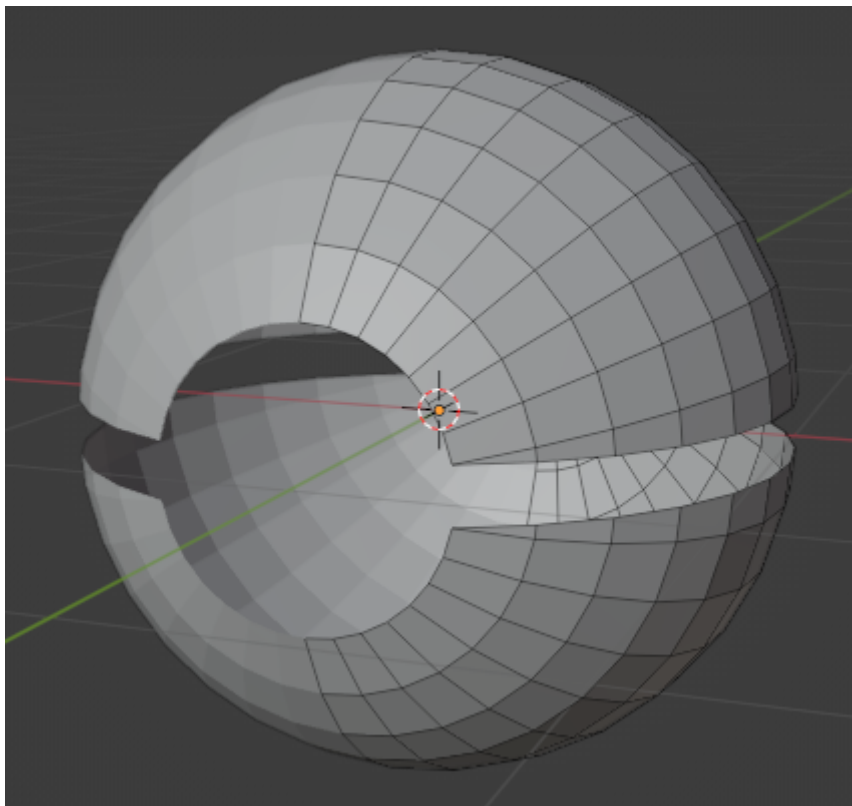

Now enable X-ray again, change to face selection mode and click and drag to select this created section:

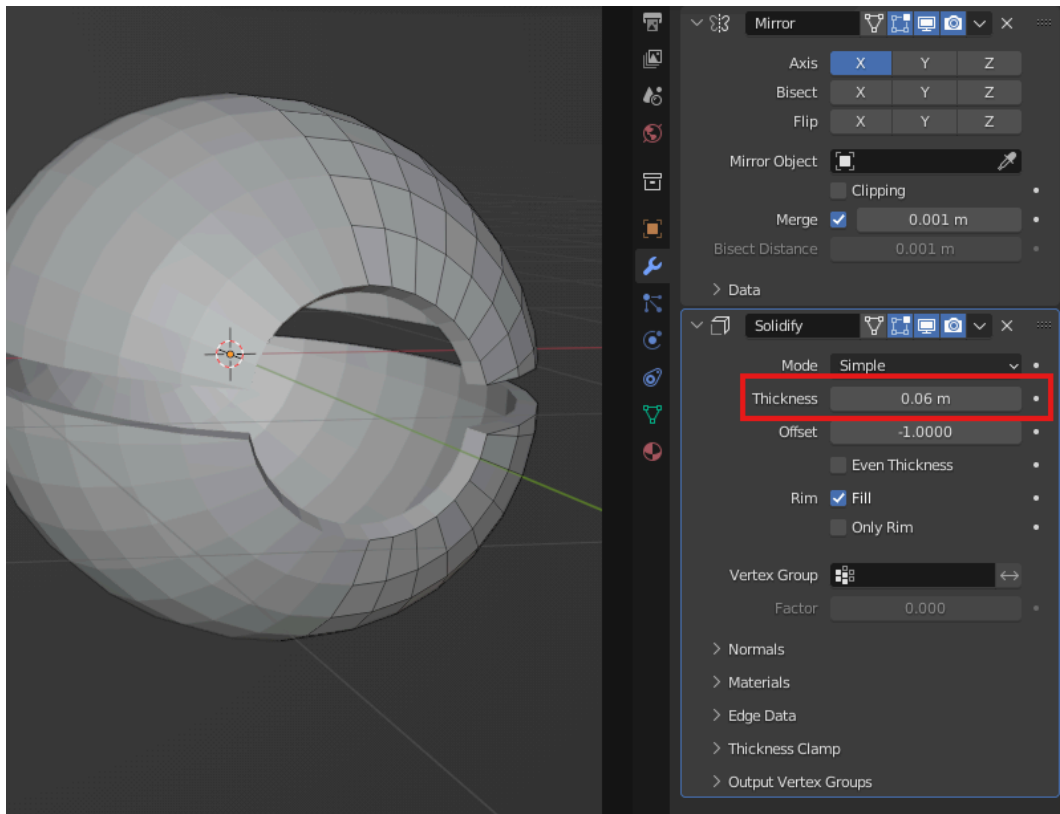

Delete the faces selected and disable X-ray mode:

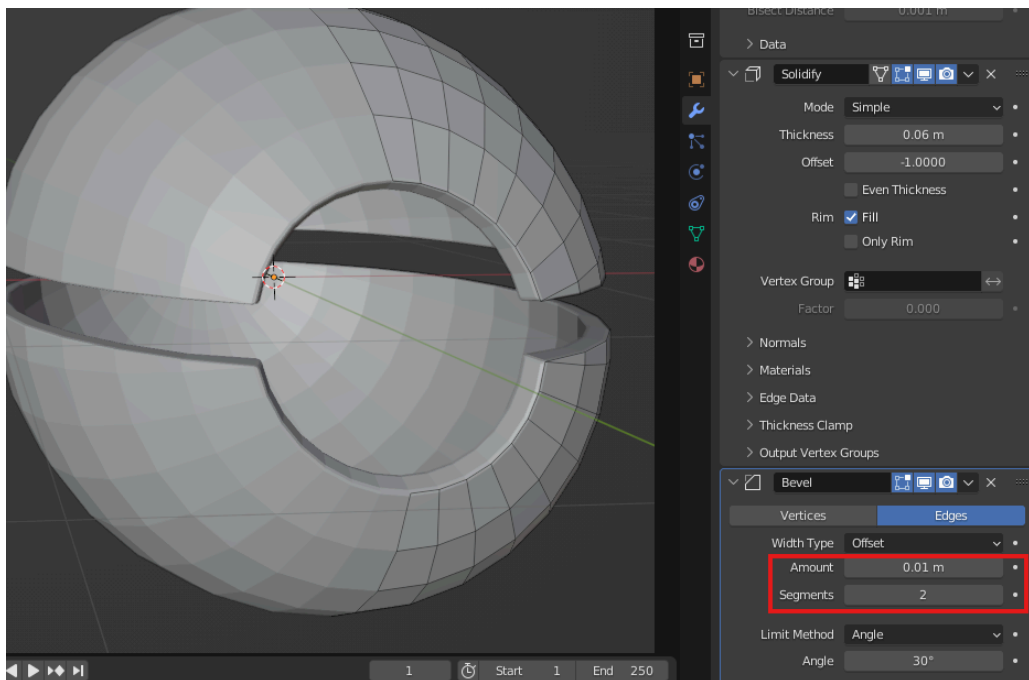

Now, if you go to the front, you should have the following mesh:

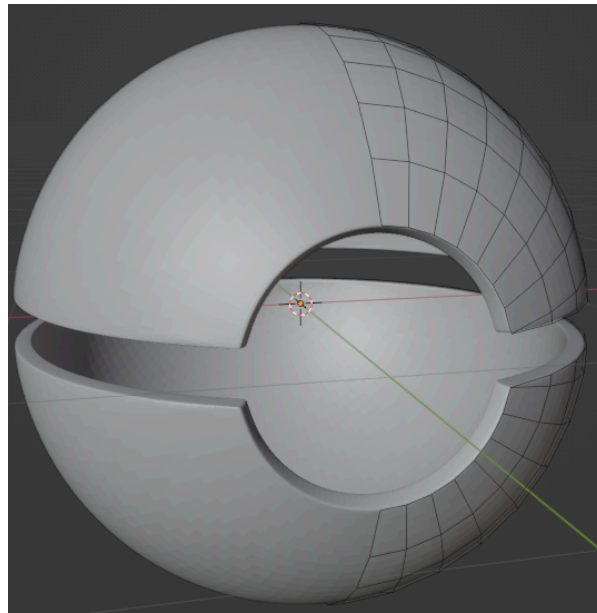

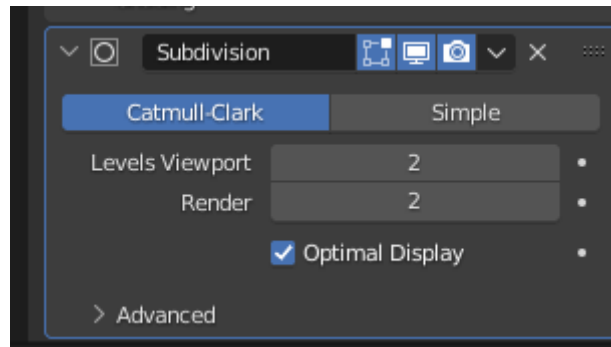

Now, add a solidify modifier, change the Thickness to 0.06:

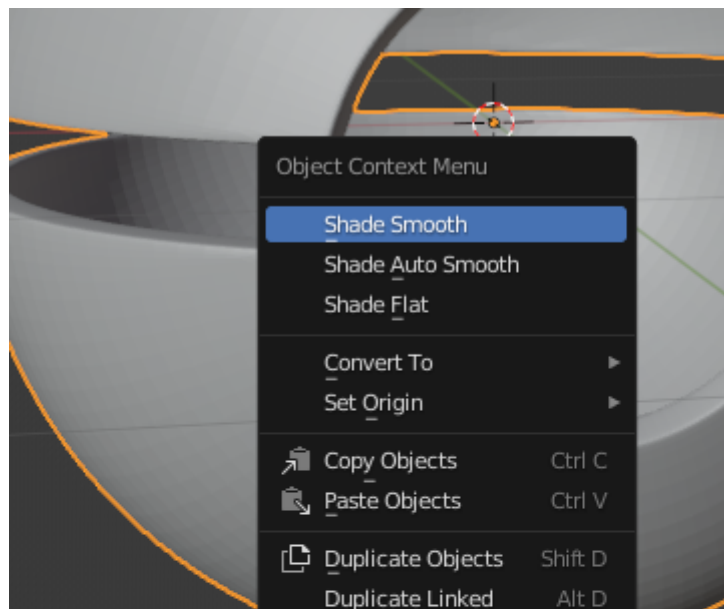

Next add a bevel modifier, change the Amount to 0.01 and the Segments to 2:

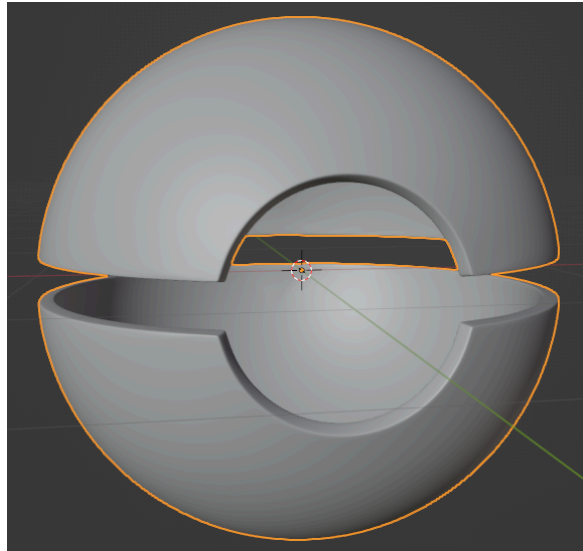

And finally add a Subdivision Surface modifier and set the Levels Viewport to 2:

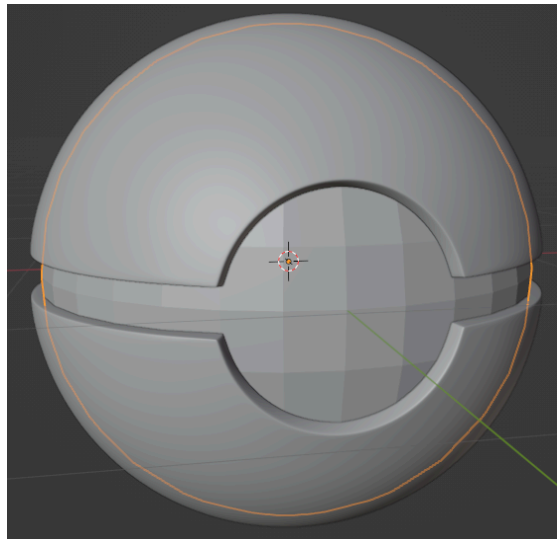

Now go back to object mode, right click on the viewport with the pokeball selected and click on "Shade Smooth":

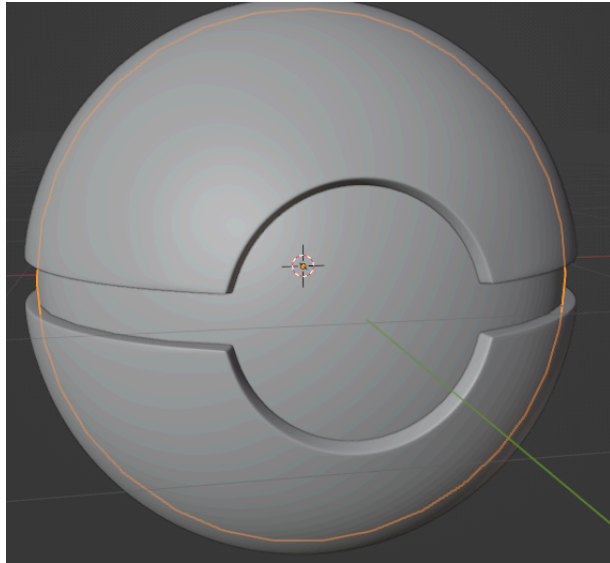

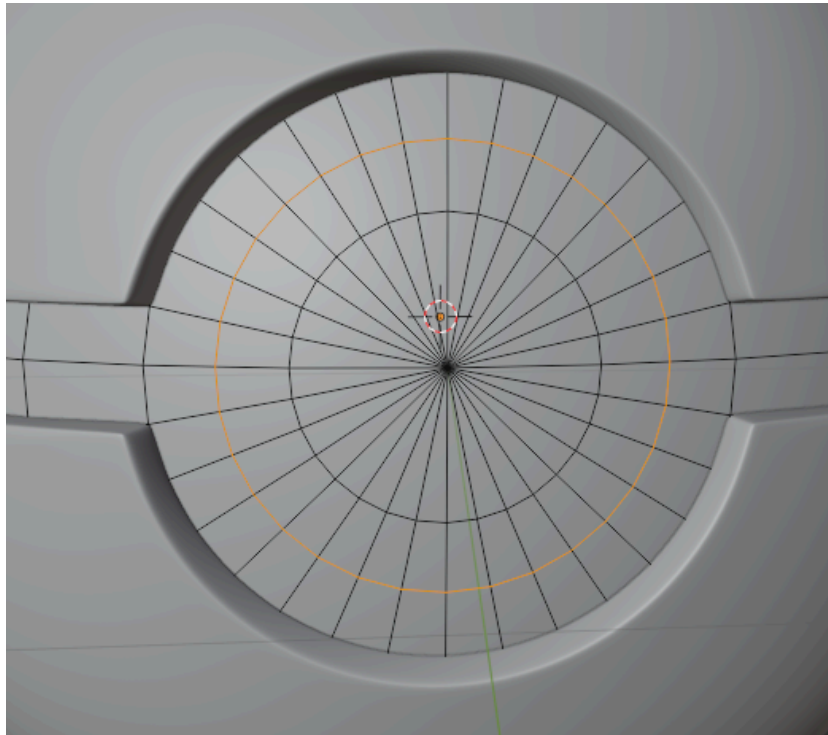

Now, make sure that the 3D cursor is at the center of the scene (you can press SHIFT + C to center it) and add a new UV sphere object (SHIFT+D → MESH → UV Sphere) to the scene and scale it down (S) by 0.95:

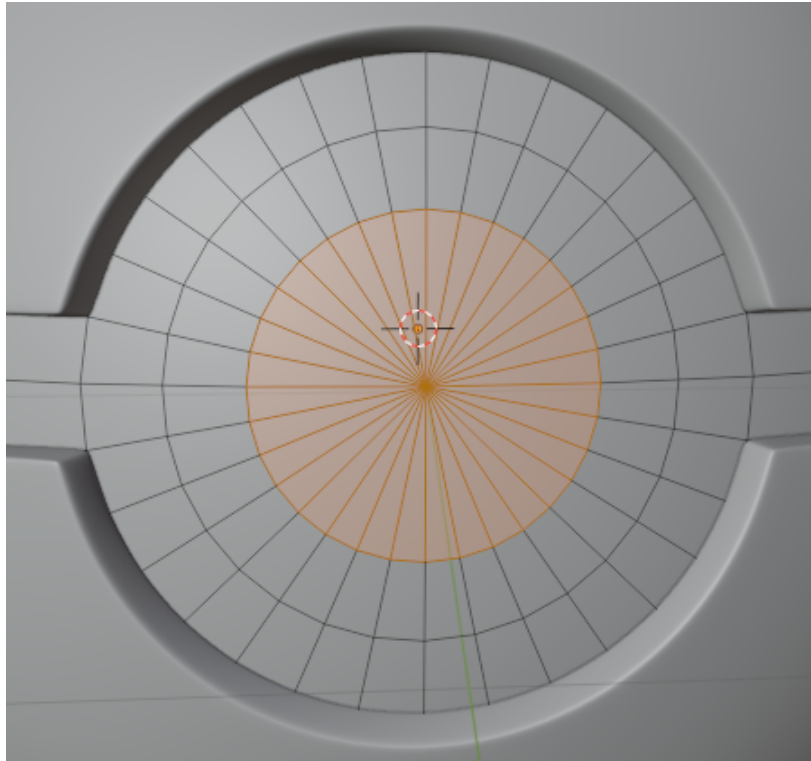

Now rotate it along the X axis (R+X) by 90° and then right click the viewport again and select “Shade Smooth” again:

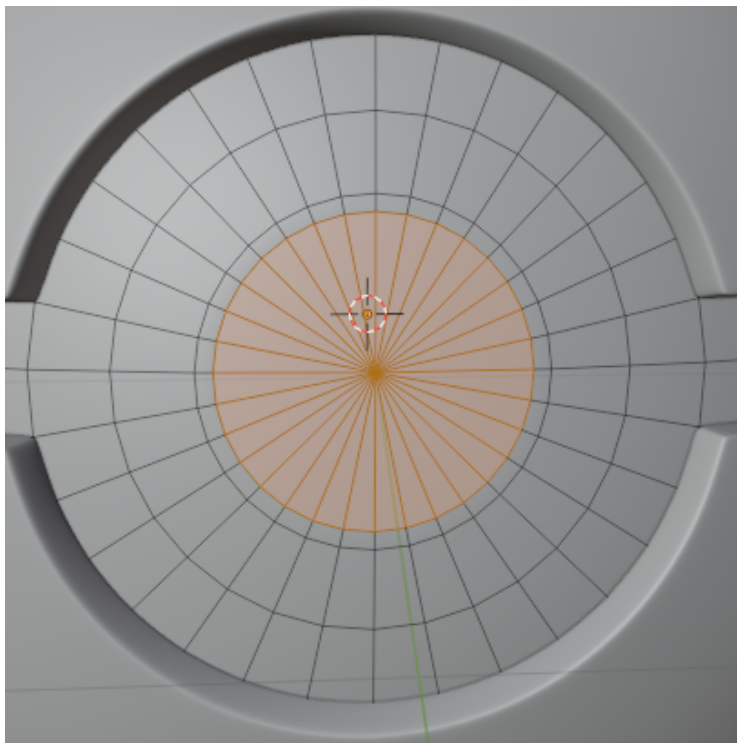

Now enter edit mode and add an edge loop by pressing CTRL + R, pointing the mouse to where the desired cut will be and double click to confirm:

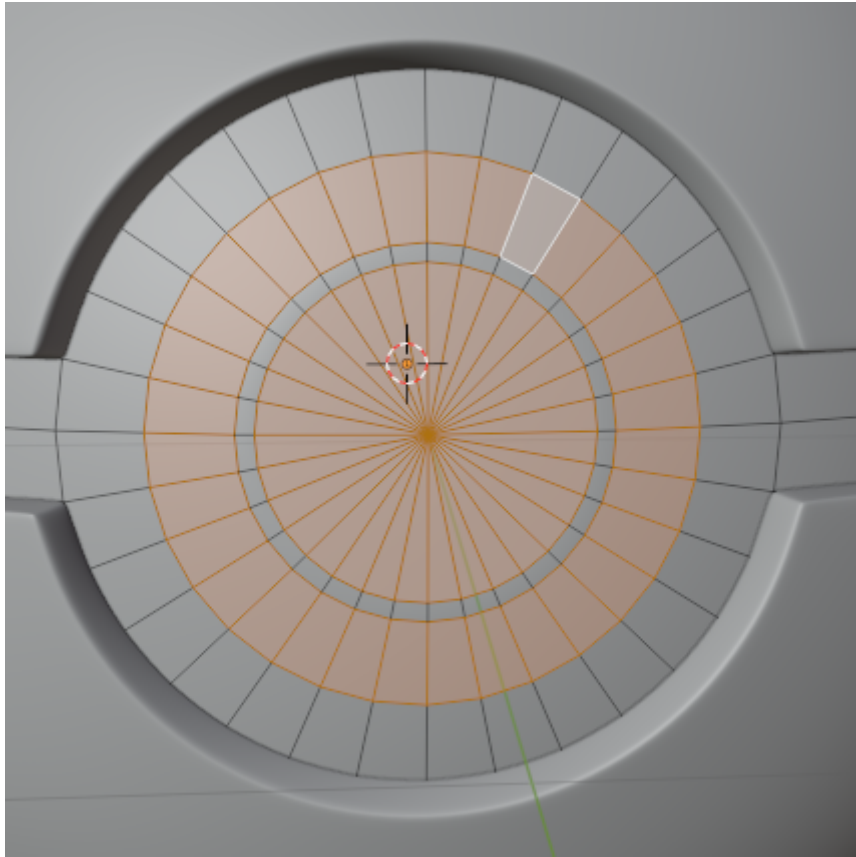

Then, change to face selection mode, click and drag to select the middle circle:

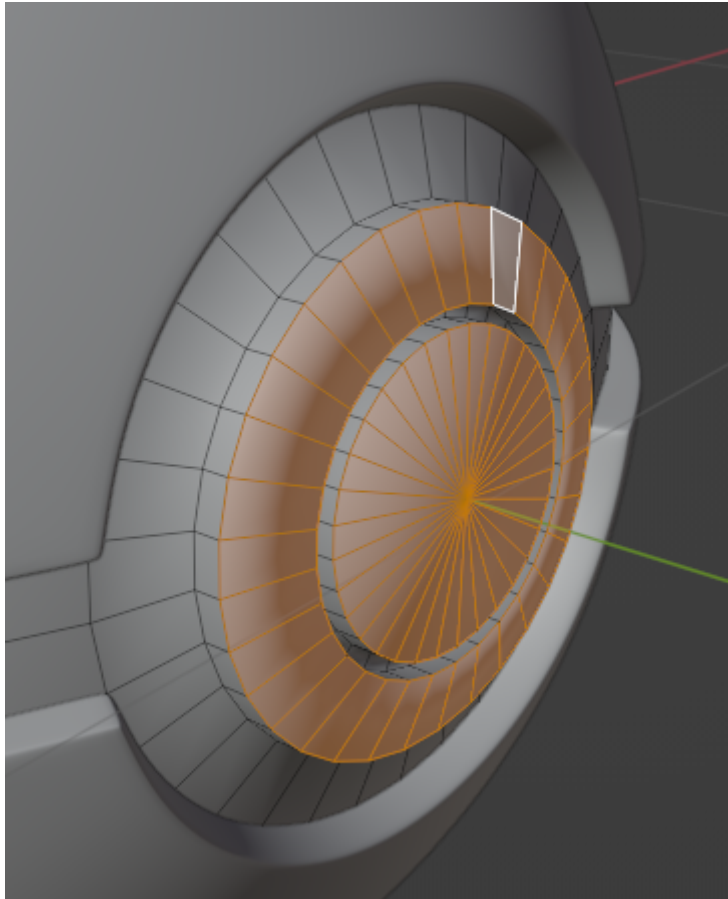

And press “I” to inset the face typing 0.02:

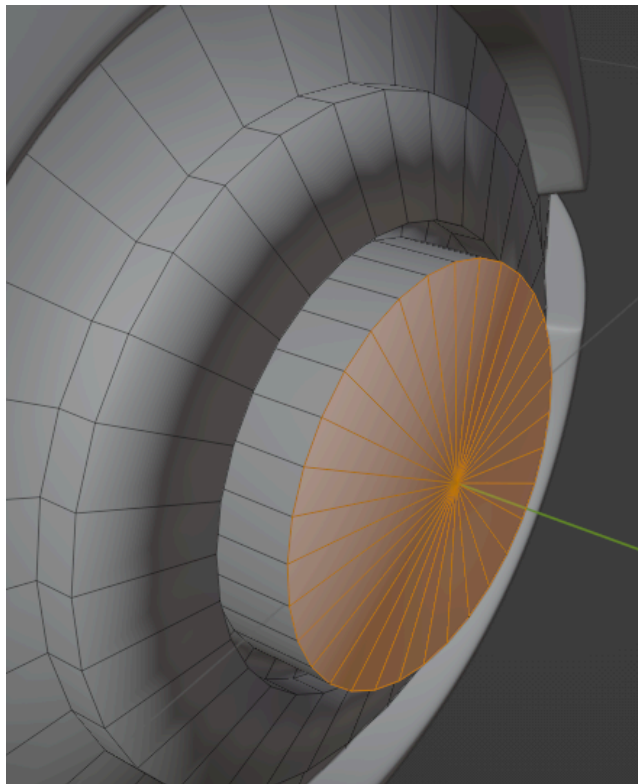

Now, with this selection, select the other face loop by holding SHIFT + ALT and then clicking on one of the faces of the loop:

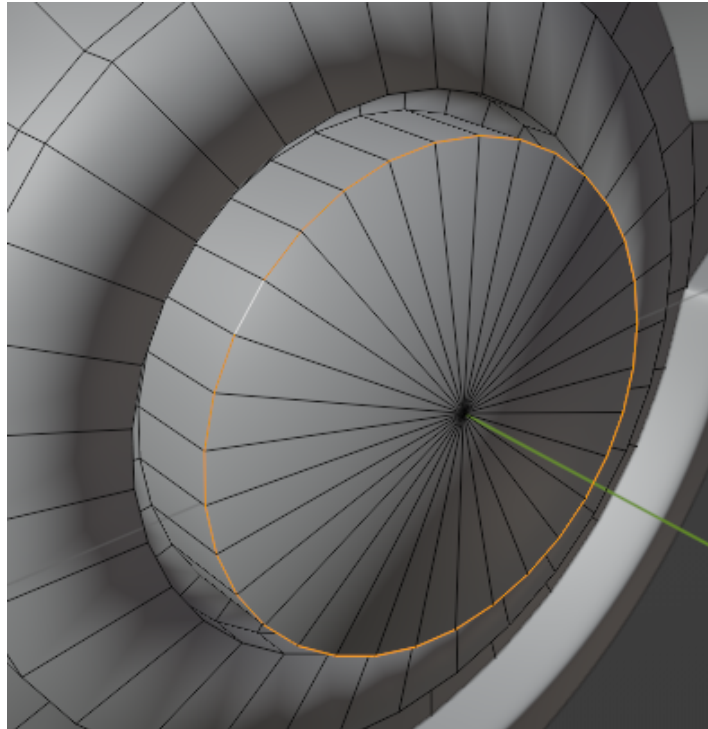

Now, press “E” to extrude and type 0.03:

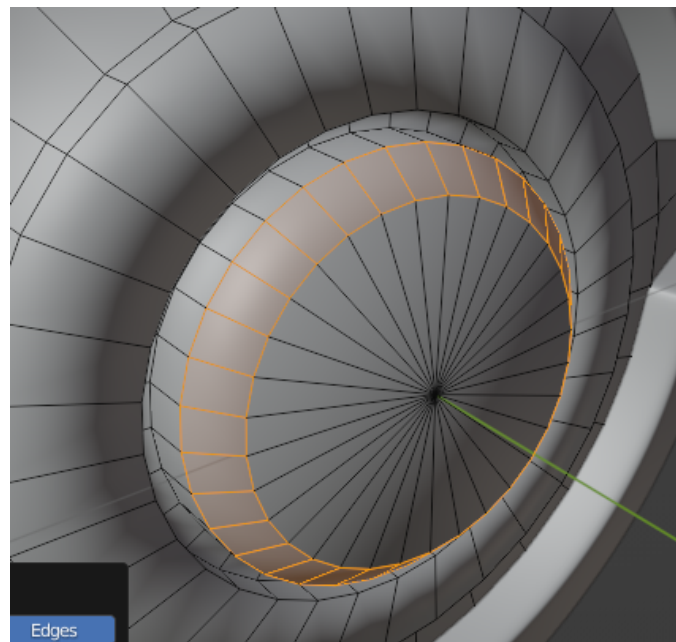

Then select only the center circle and move it along the Y axis (G+Y) by -0.04:

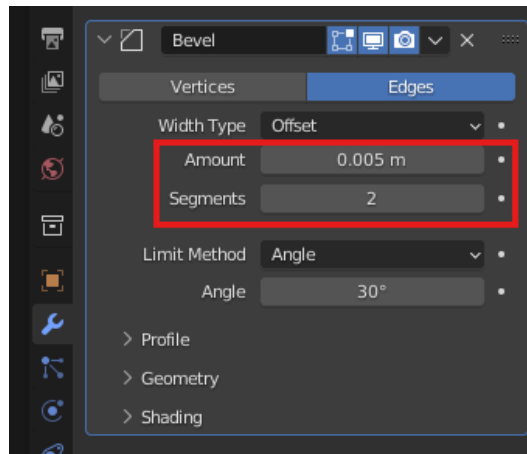

Now change to edge selection mode, select the center edge loop:

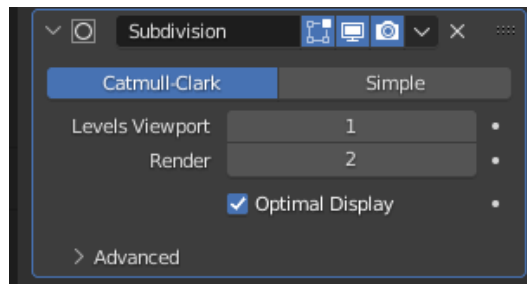

and then press CTRL + B to bevel it and type 0.03:

Now go back to object mode, add a Bevel modifier and change Amount to 0.005 and Segments to 2:

Finally, add a Subdivision Surface modifier:

There you go, now you have a pokeball!!
