

# Simple Banana Tutorial

Important concepts covered: spin tool, bevel, add edge loops

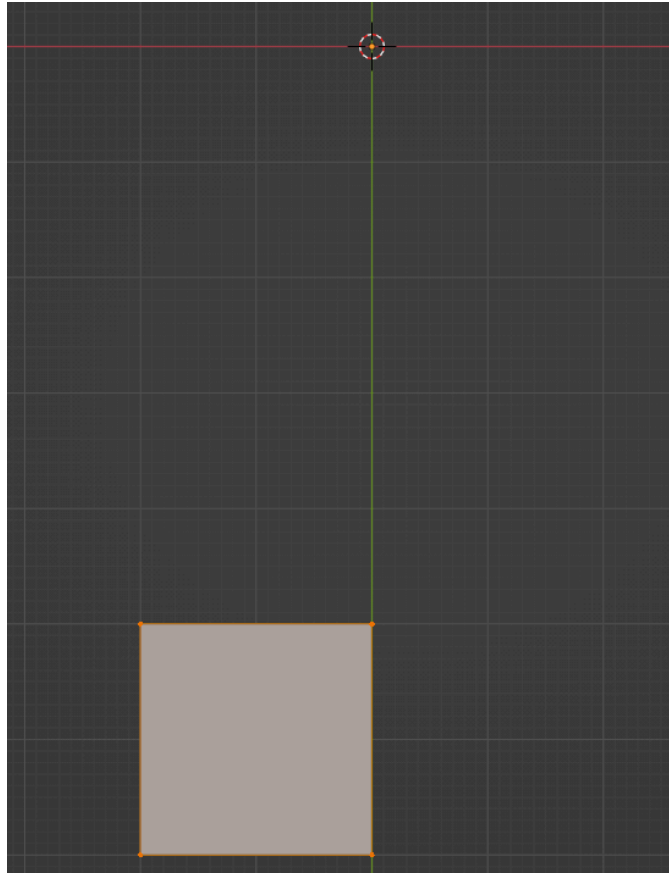

Before initializing the tutorial, make sure to save the blender project first!

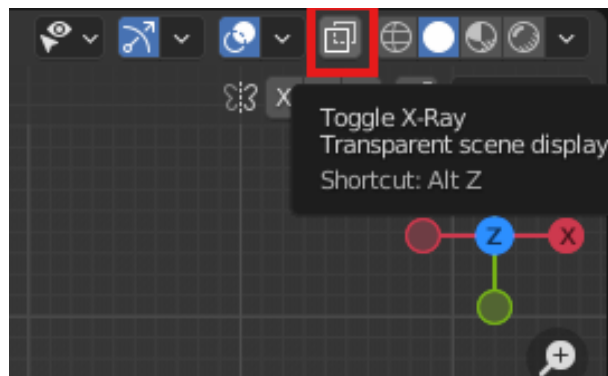

First, select the default cube and enter edit mode. Then, press NUMPAD 7 to enter the Top view:

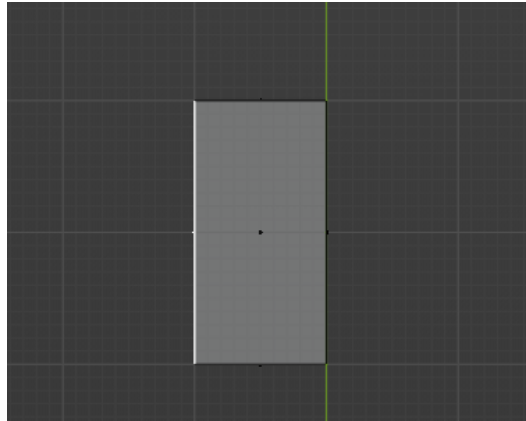

With all the mesh selected, move it in the Y axis (G+Y) by -6 and X axis (G+X) by -1:

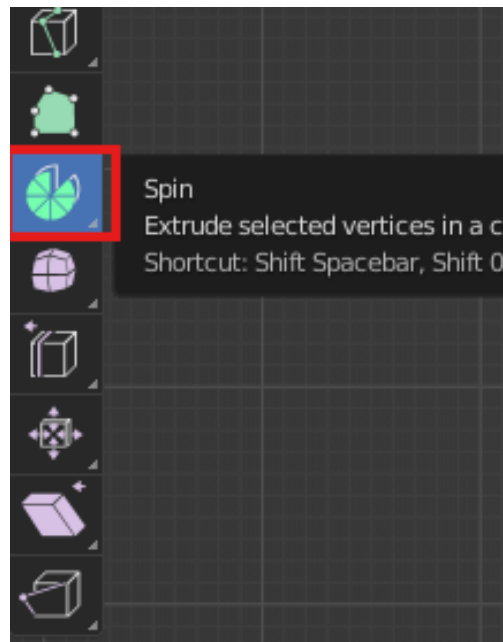

Enable X-ray mode by pressing its button on the top right corner of the screen:

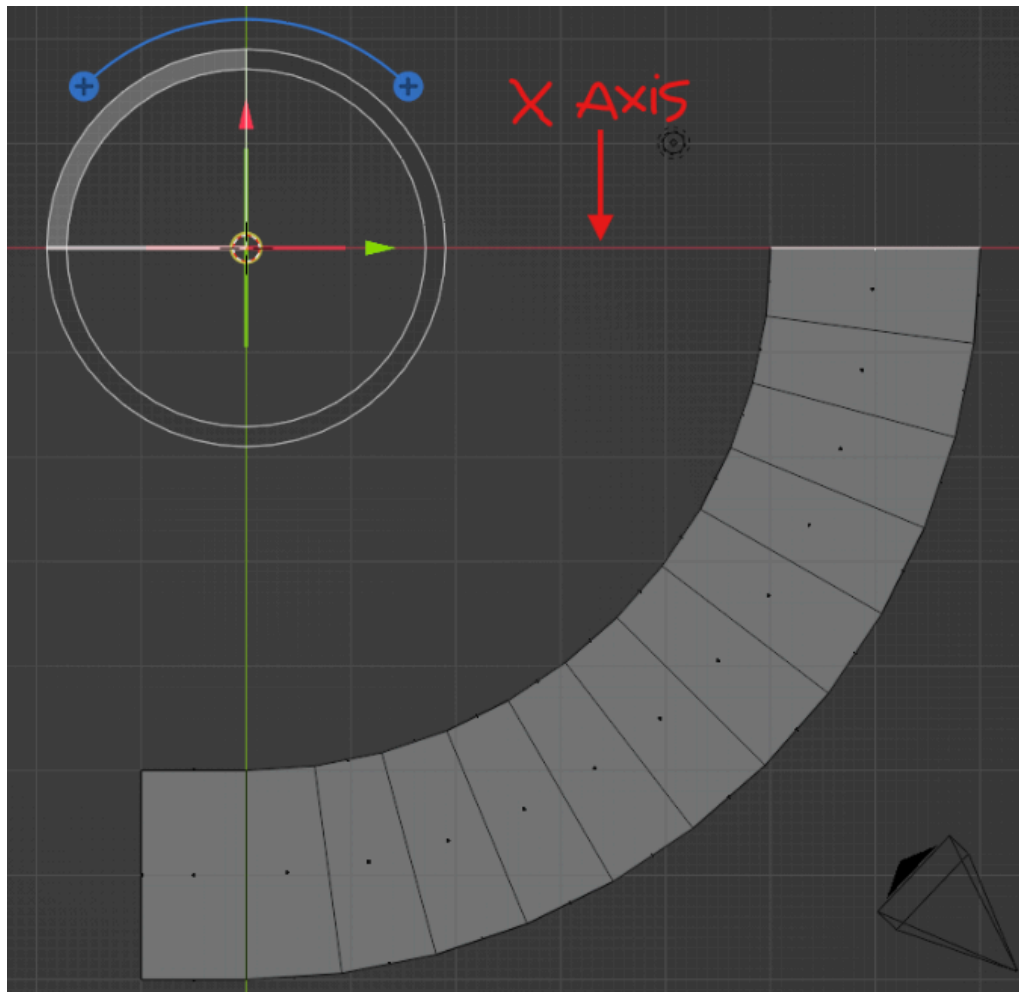

Now change to face selection mode, select the left-most face and move it in the X direction (G+X) by 1:

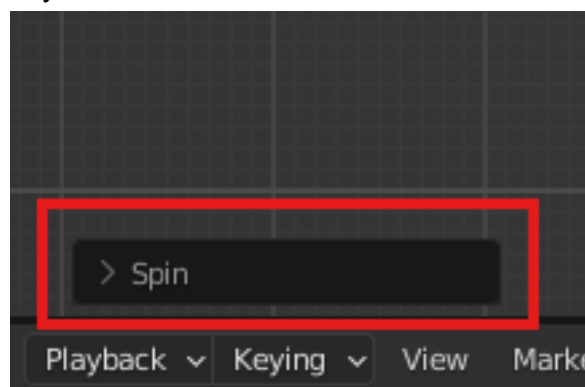

Now, select the opposite face (the right-most face) and pick the Spin tool in the left bar:

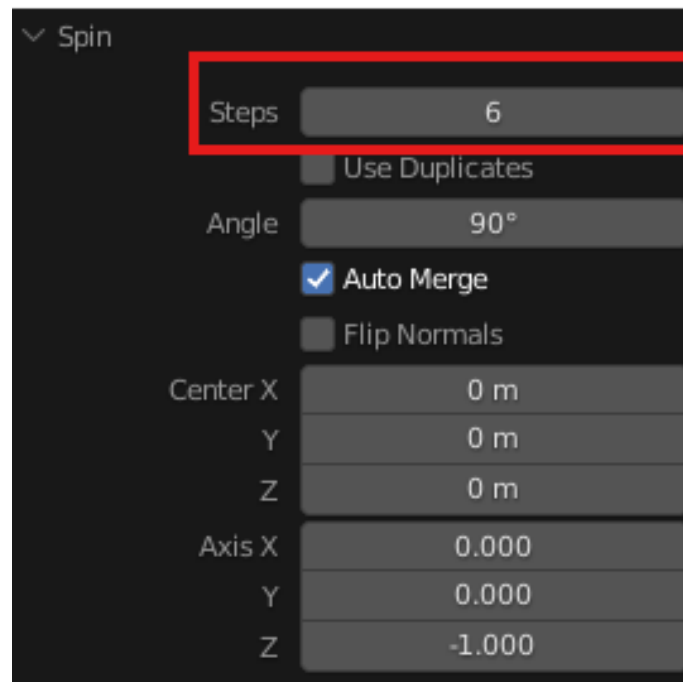

Now, click on the blue half circle that has appeared in the viewport and drag counter-clockwise. While dragging, you can hold CTRL so it will snap to the grid. Drag until the selected face touches the X axis line:

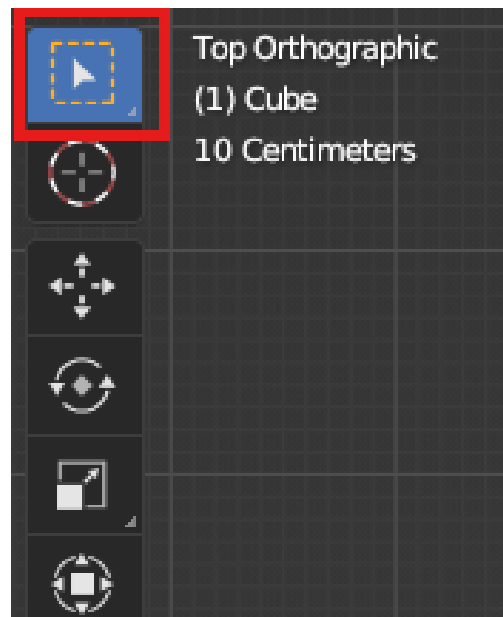

Now, open the operation properties window on the bottom left corner of the screen and change the “steps” property to 6:

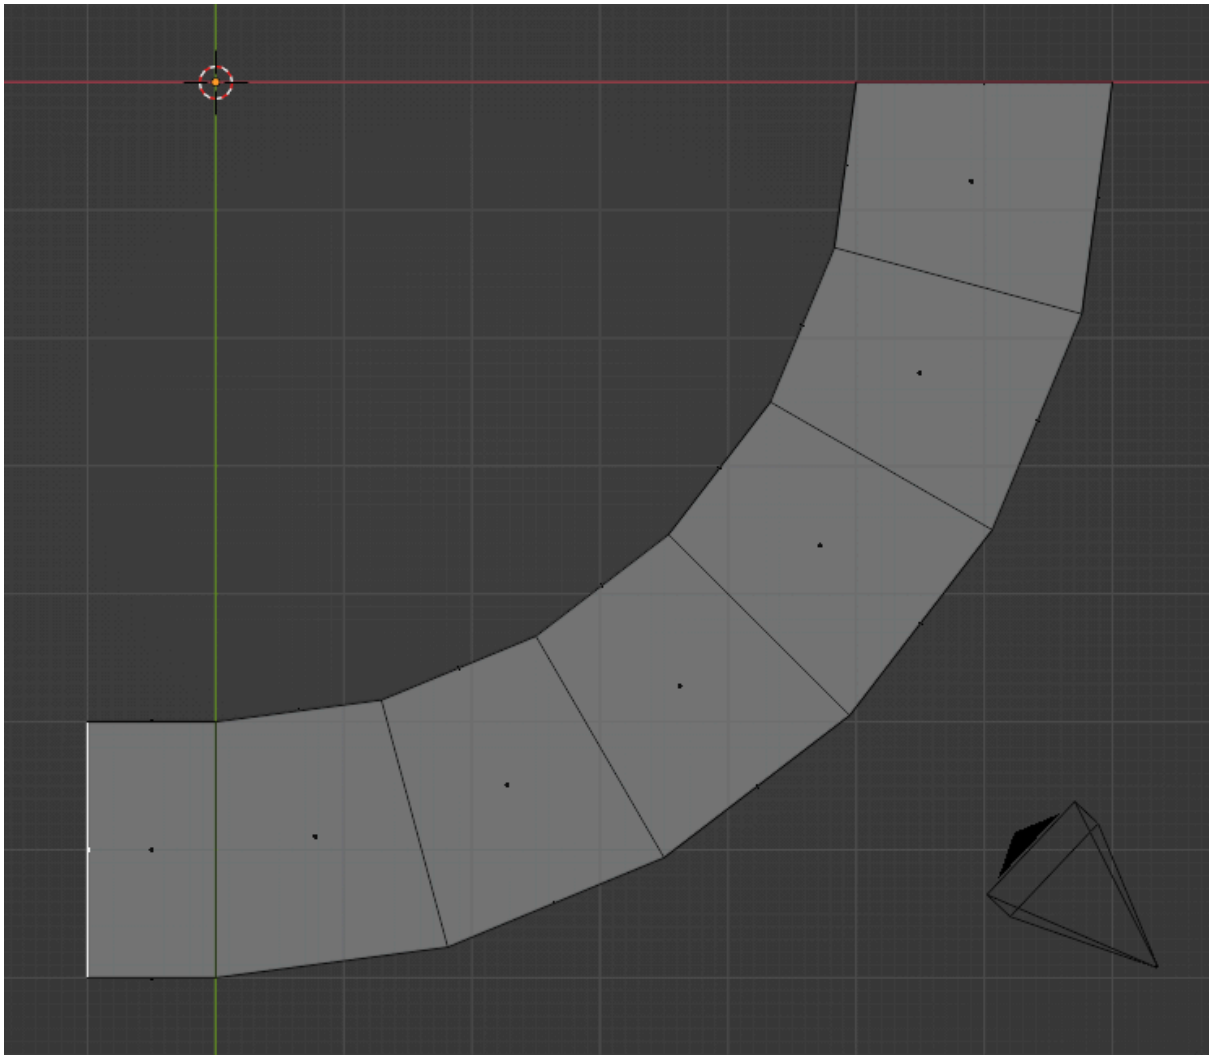

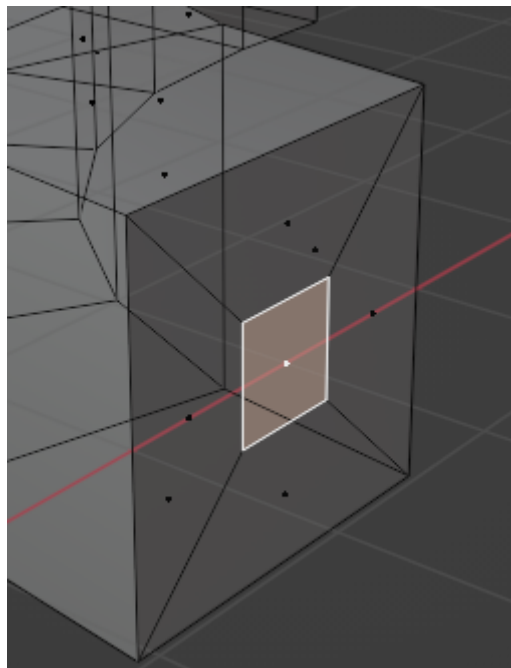

Now change back to “Select Box” tool in the left bar:

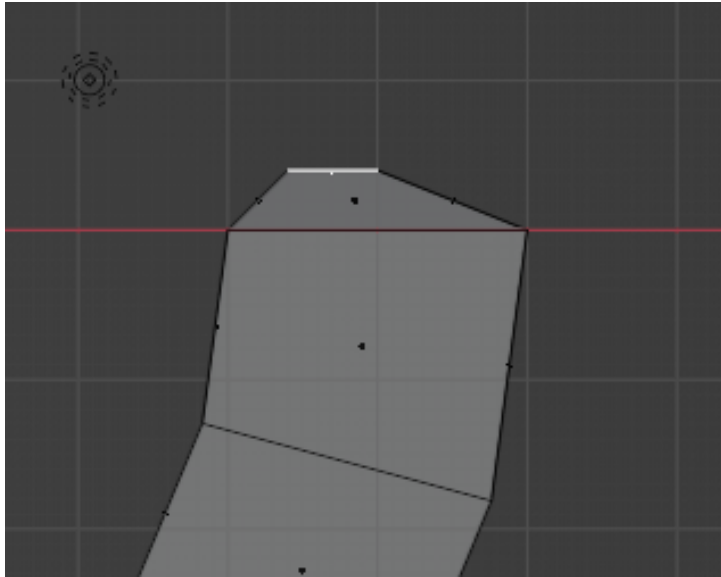

You should have the following mesh:

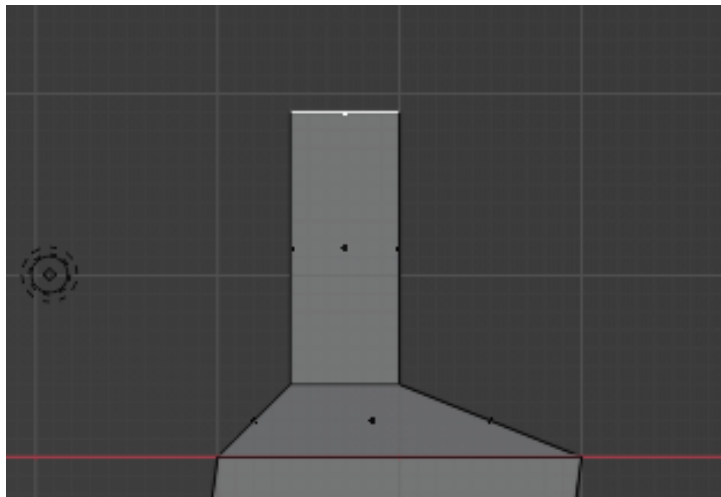

Now select the face that is touching the X axis (the upper one) and extrude (E) it and scale it (S) down by 0.3:

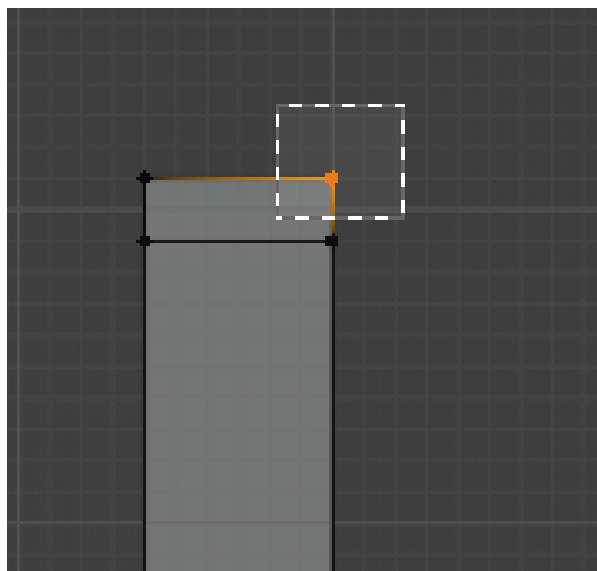

Now move it along the Y axis (G+Y) by 0.4 and then along the X axis (G+X) by -0.3:

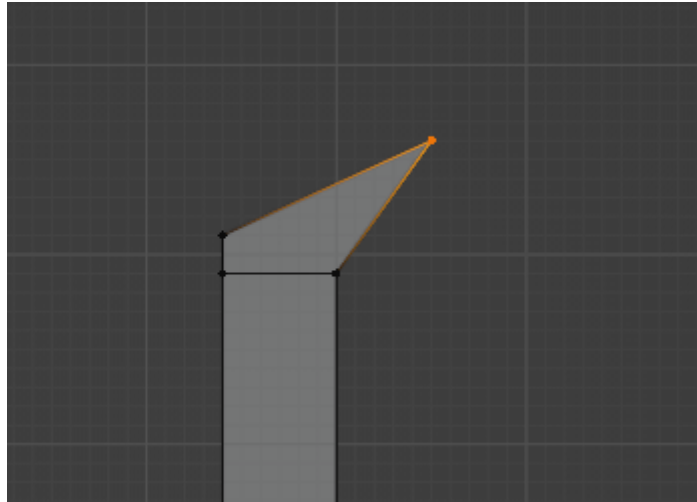

Next, extrude (E) it by 1.5:

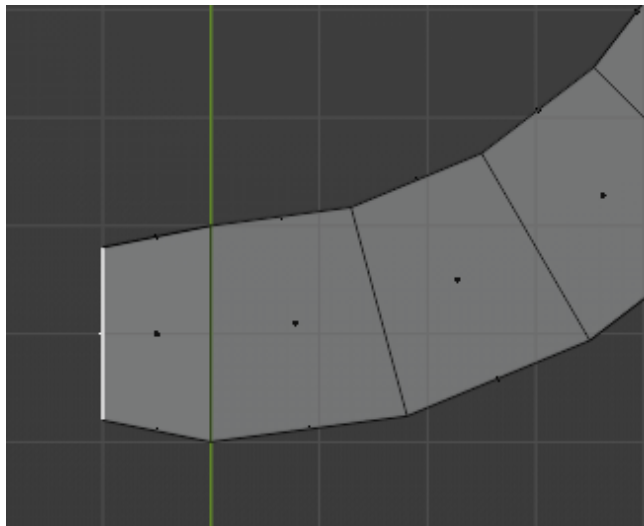

Extrude (E) again by 0.2 and then change to vertex selection mode and select the top right most vertices (click and drag):

With these vertices selected, move them along the X axis (G+X) by 0.5 and in the Y axis (G+Y) by 0.5:

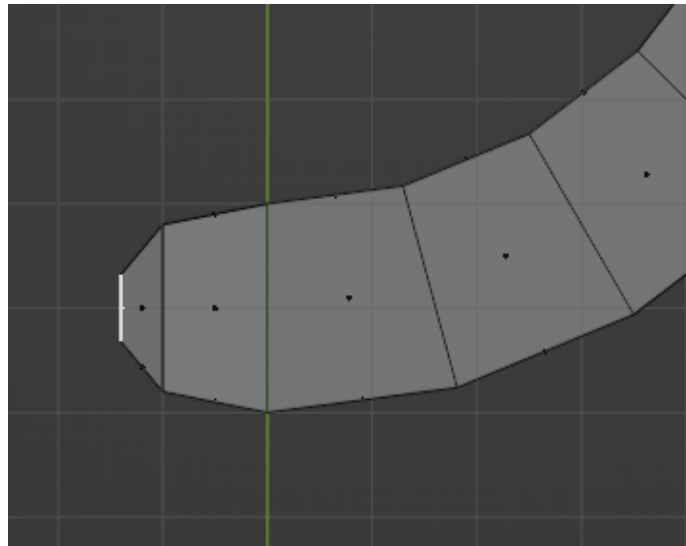

Now we have the top part of the banana modelled. Let's add details to its bottom now. First, change to face selection mode and select the bottom face of the banana and scale it (S) down by 0.8:

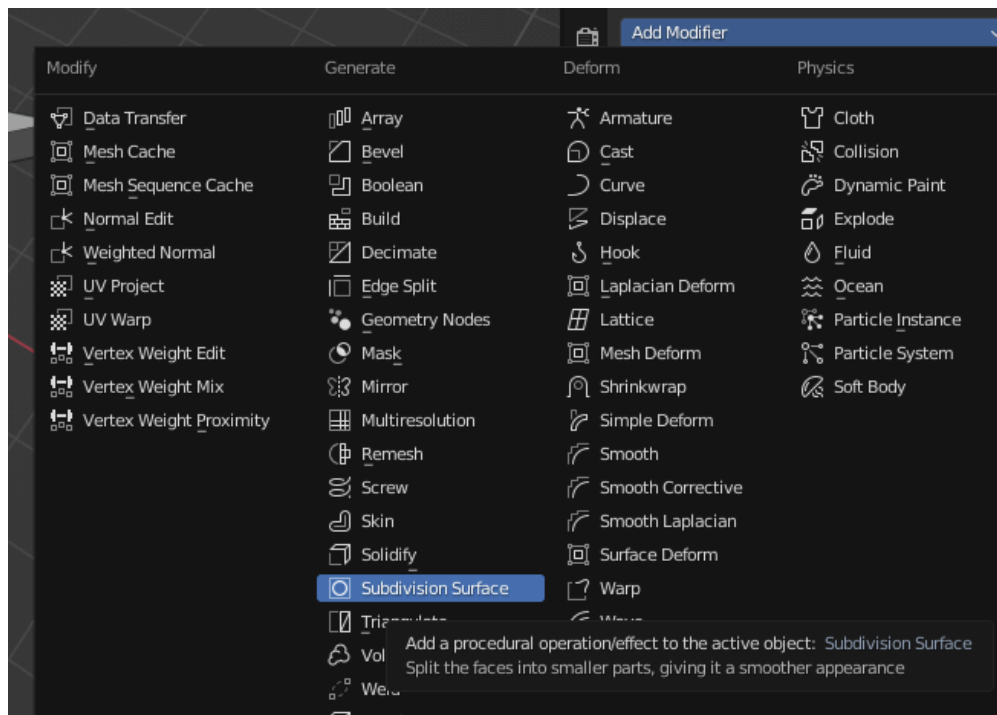

Now, extrude it along the X axis (E+X) by -0.4 and scale it (S) down by 0.4:

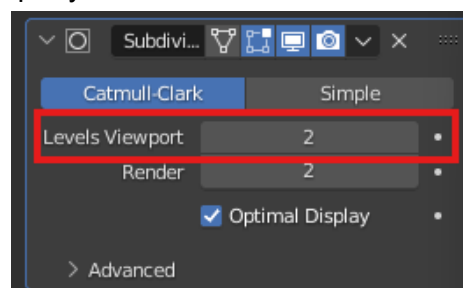

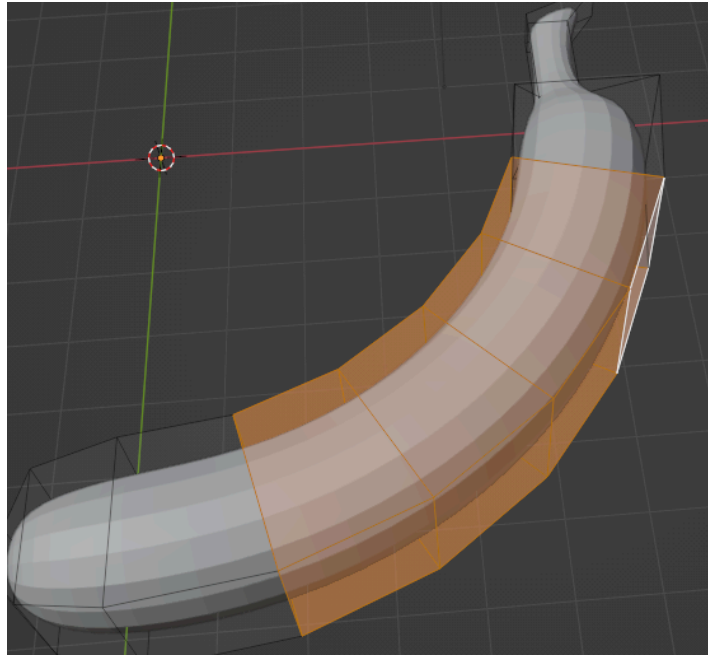

Next, disable X-ray mode and add a Subdivision Surface modifier:

Set the “Levels Viewport” property to 2:

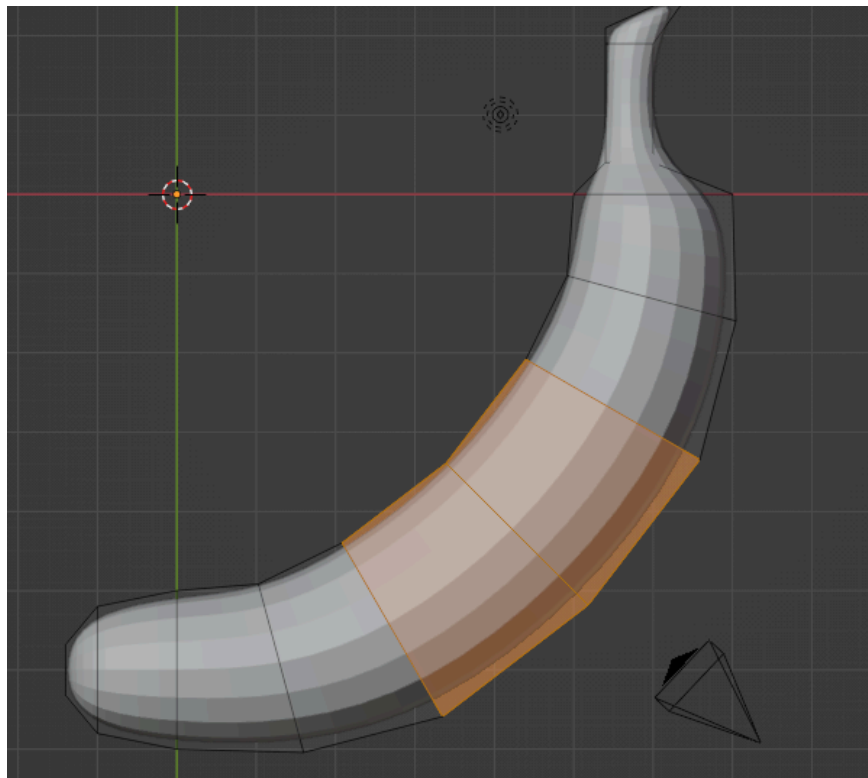

Next, select the 4 middle loops of the banana (you can select loops by pressing ALT + Left click for the first selection and then SHIFT + ALT + Left click for the next ones):

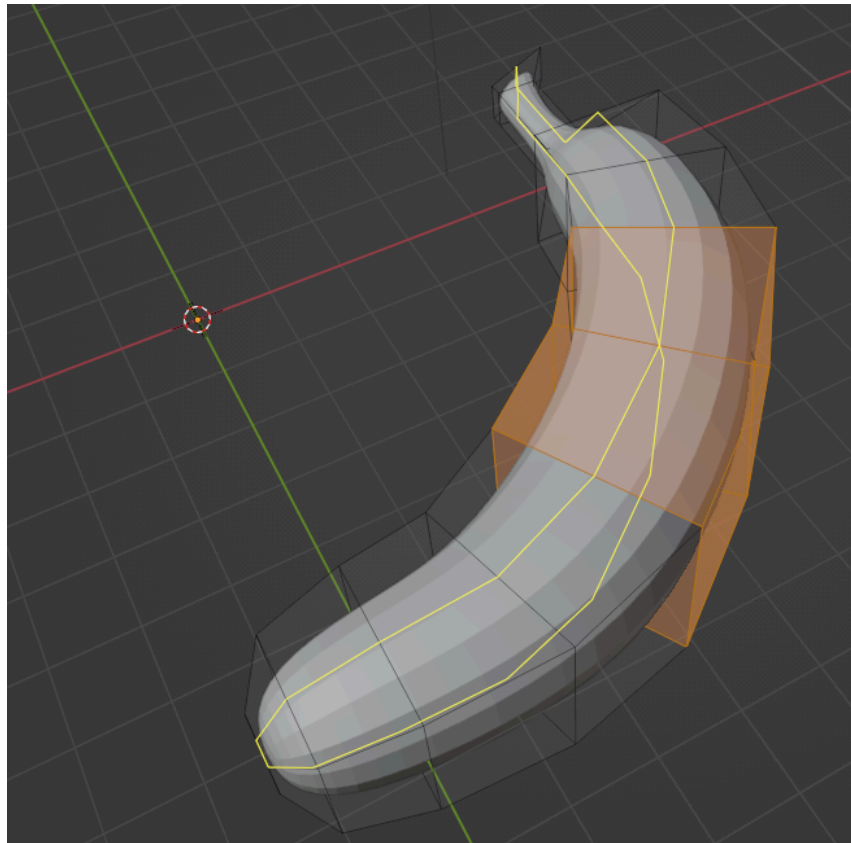

Scale (S) the selection by 1.1.

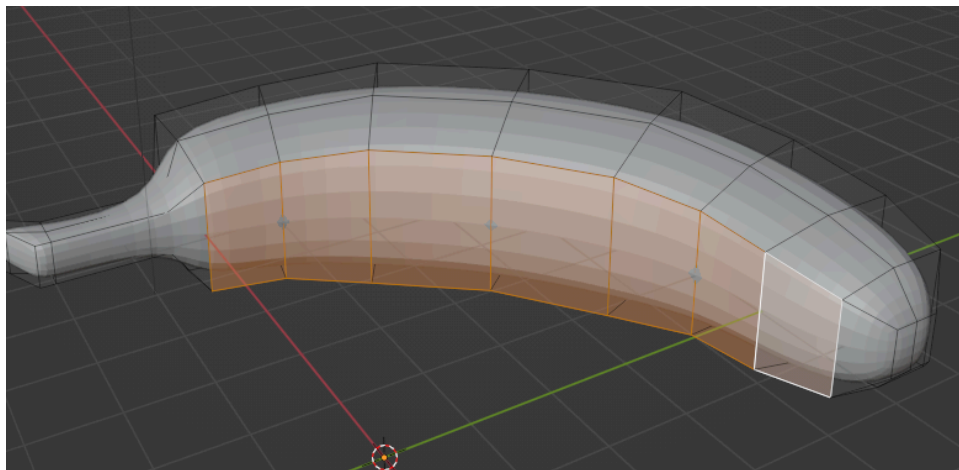

Then, deselect the outer loops (you can deselect loops by pressing SHIFT + ALT + Left click - this will maintain the other selections and deselect the loop pointed by the mouse) and scale (S) it by 1.15:

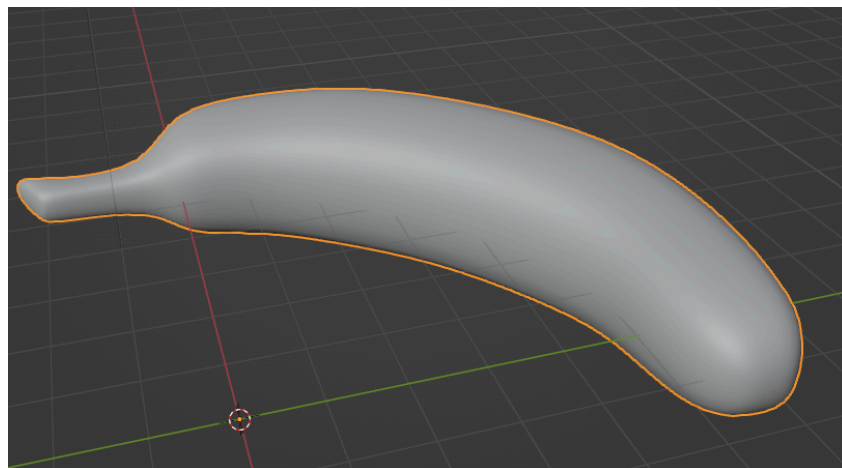

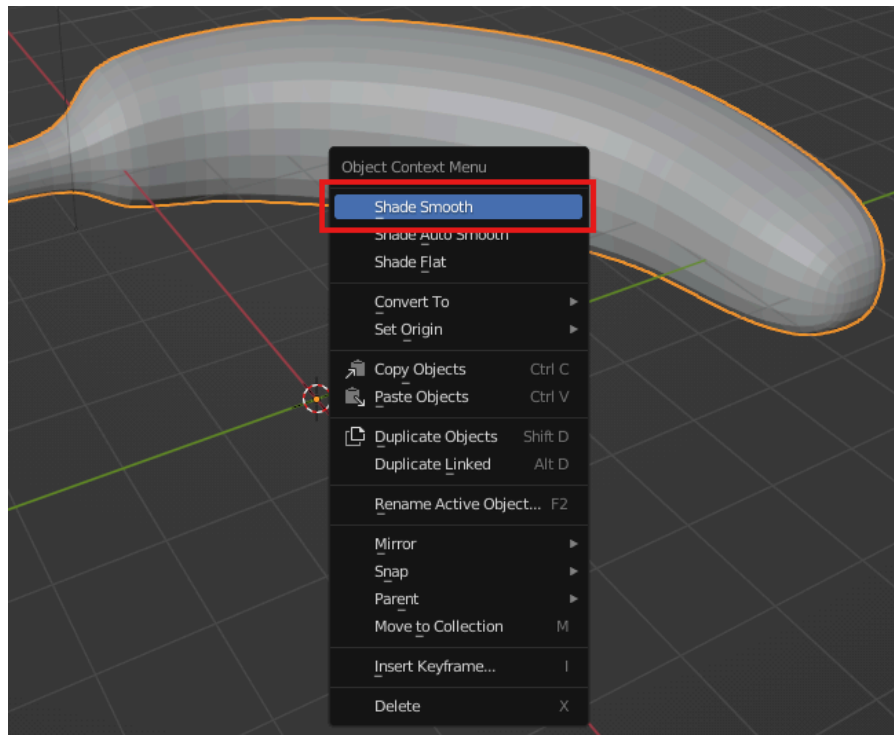

Next, add a edge loop along the banana (CTRL + R and double click to confirm):

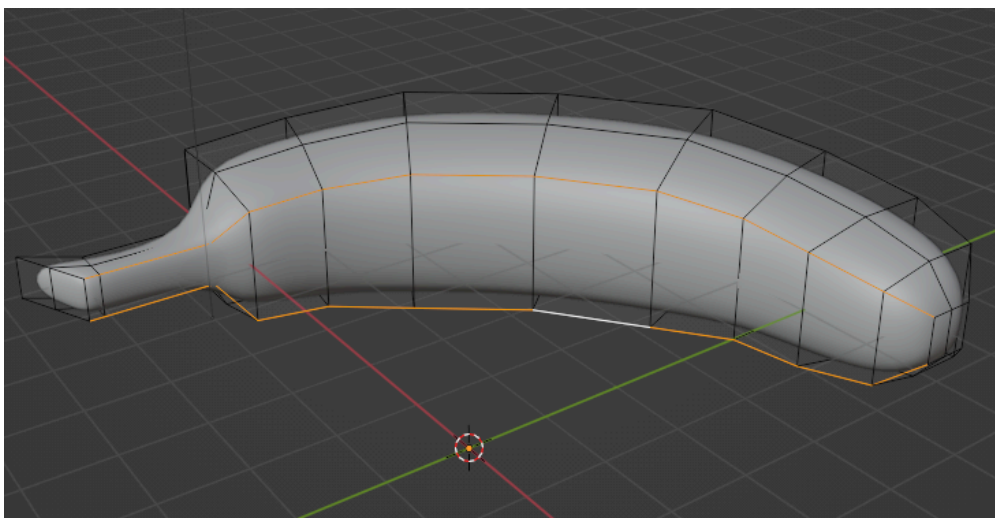

Now, change to face selection mode and select the inner faces of the banana and scale it down along the Z axis (S+Z) by 0.8:

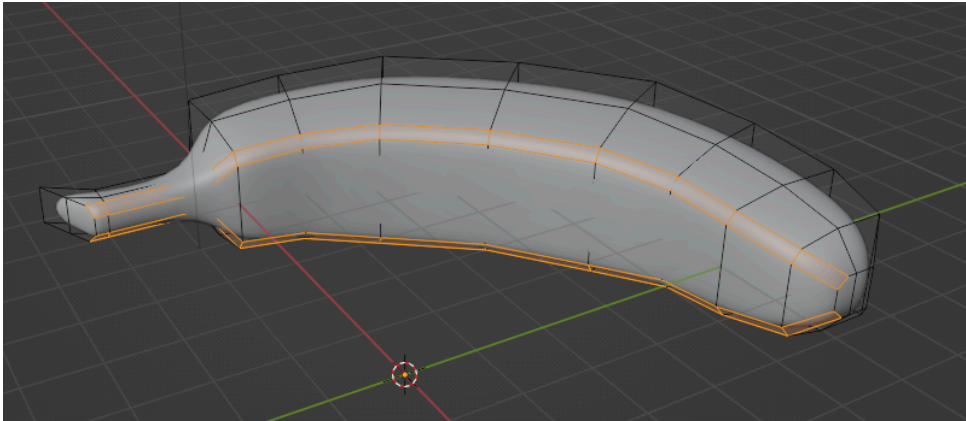

Now, to add the final details, enter object mode (TAB), right click in the viewport and select 'Shade Smooth':

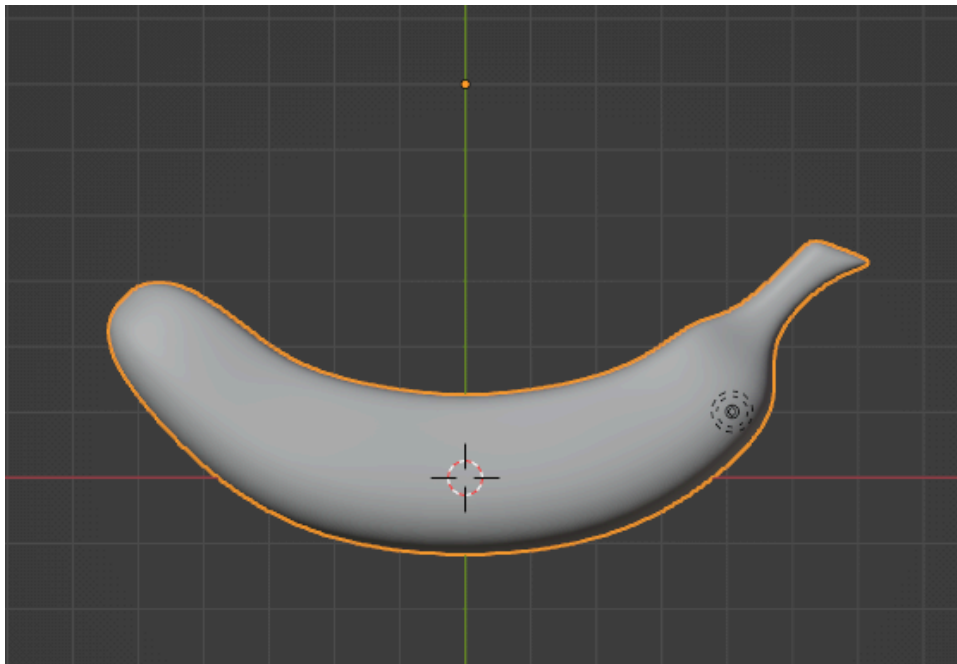

Now enter edit mode again, change to edge selection mode and select the following edge loops:

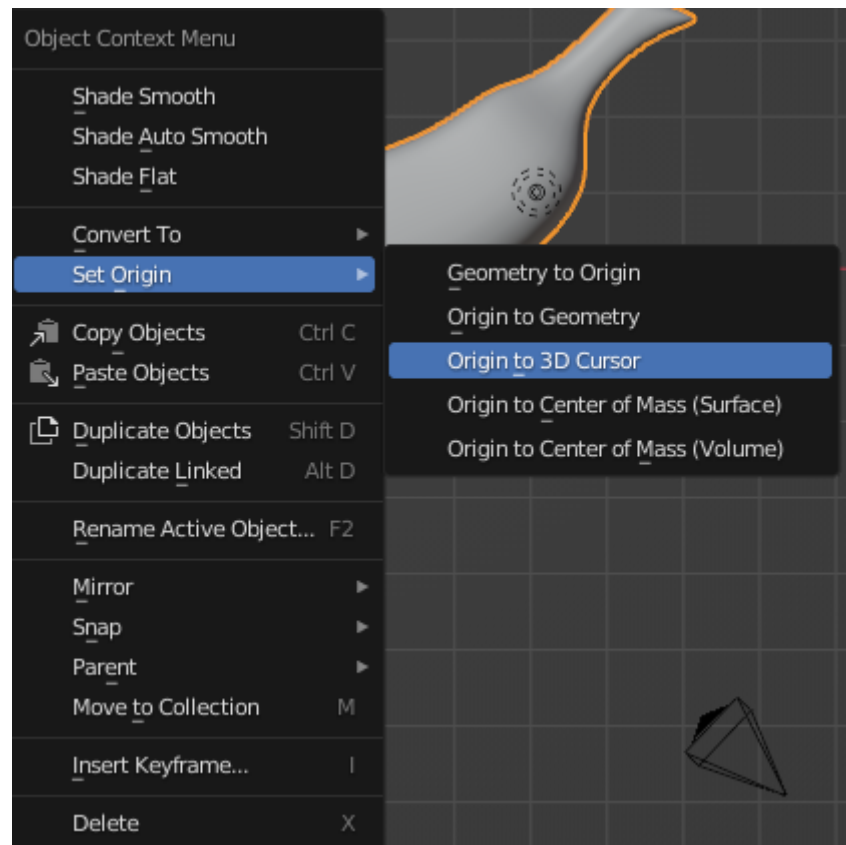

And then bevel them (CTRL + B) by 0.15:

Next, go back to object mode, rotate the banana along the Z axis (R+Z) by  $-45^\circ$  and move it along the Y axis (G+Y) by 6:

Finally, as you can see, the origin of the object is not centered. So to fix it, right click in the viewport with the banana selected, go to "Set Origin" and then "Origin to 3D Cursor":

You should have the banana now finished!
