

Simple Stairs Tutorial

Important concepts covered: bevel, duplicate, extrude

With the default cube selected, enter edit mode. Then, go to the front view by pressing NUMPAD 1, change to edge selection mode and select the top edge:

Then, press CTRL + B to bevel the selected edge and type 1.75:

Now, open the little window that has appeared on the bottom left corner of the screen with the name “Bevel” and change the segments to 16, profile type to “Custom” and then select “Steps” as the preset:

Now, select the diagonal opposite edge, bevel (CTRL + B) by typing 1.8:

We want it to be straight, so open the Bevel window again and change the settings to have 1 segment:

Now change to face selection mode, select the upper face of the stair and extrude (E) it and type 2 in order to create a platform:

Now select all the mesh by pressing “A”, duplicate it (SHIFT + D) and move along the Z (press Z) axis and type 1.75:

Then, rotate it along the Z axis (R + Z) and type -90° and move it along the X (G + X) axis and type 2.215:

Next move it along the Y axis (G + Y) by 1.784:

Now go to the Right view by pressing NUMPAD 3, change to edge selection mode and select the bottom diagonal edge:

Duplicate it (SHIFT + D) and move along the Z axis (G + Z) by 1.3:

Now change to vertex selection mode, select the left most created vertex and move it along the Y axis (G + Y) by -0.2 and along the Z axis (G + Z) also by -0.2:

Then, select both vertices of the created edge, press ALT + E, select “Extrude Vertices”, press “Z” to extrude along the Z axis and then type -1.1:

Now hover the mouse over one of the vertices and press “L” in order to select all the linked mesh of these created edges:

Then, press “P” and select “Selection” to separate it into another object:

Now press “TAB” to go to Object mode, select the separated edges and enter edit mode again (TAB):

Select the following vertices, press “CTRL + B” to bevel and then press “V” to enable beveling vertices. Then, type 0.2 and increase the segments to 5 (by using the mouse scroll):

As you can see, the bevelled vertices are weird because we had previously changed it. So in order to solve this, open the Bevel window again and change the “profile type” to be “Superellipse”:

Now press “A” to select all and duplicate it and move along the X axis (G + X) by -2:

Now select all again and scale it along the X axis (S + X) by 0.9:

Now go back to object mode, right click the viewport with the object selected, click on “Convert To” and select “Curve”:

Now go under “Object Data Properties” → “Geometry” → “Bevel” → “Depth” and change it to 0.03:

As you can see, they are the railings of the stairs.

To finalize the stairs, let's copy these railings to the second set of stairs. With the railings selected, duplicate it (SHIFT + D) and confirm (so it is duplicated in place). Then, move it along the Z axis (G + Z) by 1.75, then along the Y axis (G + Y) by 2 and finally along the X axis (G + X) by 2:

Finally rotate it along the Z axis(R + Z) by -90° :

You have now a simple stairs modelled:
